Hackathon Finalists Report

DeepSeek vs LLaMA: Kill the Cloud Challenge

16 Finalist Teams – On-Device AI App Proposals

Executive Summary

This report synthesizes the proposals from all 16 finalist teams in the DeepSeek vs LLaMA: Kill the Cloud hackathon. The challenge tasked participants with building applications powered by on-device AI using edge intelligence, prioritizing privacy-first and offline-capable architectures. Teams leveraged small language models (SLMs) including DeepSeek and LLaMA variants, vision models, speech-to-text engines, and embedding models to create solutions spanning healthcare, legal aid, emergency response, personal productivity, industrial intelligence, and outdoor survival.

The proposals demonstrate a strong emphasis on three core pillars: (1) complete offline functionality with zero cloud dependency, (2) absolute data privacy with no data egress, and (3) real-time responsiveness through local inference. Common technical approaches include quantized LLMs (4-bit/8-bit), mobile-optimized vision models like MobileNet, voice processing via Whisper Tiny, and multi-agent architectures combining reasoning and utility models.

Team Proposals

Below is a detailed breakdown of each finalist team's proposal, including the problem they identified, their target users, the proposed solution, and the technology stack.

1. InvestWise AI

Team: Team FinEdge | Leader: Saghana Muthukumaran

Problem / Idea	An AI-powered investment intelligence platform that provides smart, simplified investing guidance entirely on-device, ensuring user financial data never leaves the phone.
Target Users	Retail investors, individual traders, and financially conscious users seeking private, offline investment analysis.
Solution	InvestWise AI leverages on-device language models to analyze market data, provide stock predictions, and deliver personalized investment insights without requiring cloud connectivity.
Tech Stack	On-device LLM inference, local data processing, privacy-first architecture

2. UPLINE – Emergency Triage, Not Diagnosis

Team: Codenova | Leader: Hunny Sharma

Problem / Idea	A mobile-first emergency triage application that helps users assess and prioritize medical emergencies using on-device AI, explicitly designed for triage (not diagnosis).
Target Users	Emergency bystanders, first responders, community health workers, and individuals in areas with limited medical access.
Solution	UPLINE uses on-device AI models to guide users through structured triage protocols, helping them assess injury severity and take immediate action without needing internet connectivity.
Tech Stack	On-device AI models, mobile-first design, offline-capable triage engine

3. VAULT.AI – A Fully Offline, Privacy-First Personal Intelligence Engine

Team: Visionary Vanguards | Leader: Penjendru Varun

Problem / Idea	Cloud AI suffers from data privacy breaches, latency due to network dependency, and complete security failure in offline or remote environments. VAULT.AI addresses all three by running intelligence entirely on-device.
Target Users	Privacy-conscious professionals, users in offline/remote environments (subways, airplanes, rural areas), and anyone needing secure, instant AI assistance.
Solution	A fully offline, on-device AI assistant that never sends data to the cloud. Features multimodal interaction (voice + text), local processing with zero latency (<100ms response), AES-256 encryption, and works anywhere with zero connectivity.
Tech Stack	DeepSeek (distilled reasoning model), Llama 3 8B (fast chat inference), Silero VAD + Whisper Tiny (quantized STT), Piper TTS (on-device audio), Neural Processing Unit (NPU), AES-256 encryption

4. SMOLegal: Legal Aid for Rural India

Team: AXIS | Leader: Pankaj Kumar

Problem / Idea	Rural India lacks access to affordable legal aid. Language barriers, low legal literacy, and no internet in remote areas prevent millions from understanding their rights or navigating legal processes.
Target Users	Rural Indian citizens, farmers, daily wage workers, women in rural communities, and grassroots legal aid workers.
Solution	SMOLegal provides AI-powered legal assistance using small language models that run on-device, offering multilingual legal guidance without internet connectivity, making legal knowledge accessible to underserved communities.
Tech Stack	Small language models (SLMs), on-device inference, multilingual NLP, offline-first mobile architecture

5. PulseMesh: Zero-Cloud Emergency Medical Triage & Coordination

Team: OPTIMALS | Leader: Raj Aryan Singh

Problem / Idea	Disasters destroy connectivity infrastructure instantly, yet critical medical decisions must happen in seconds. Cloud AI fails due to network dependency, latency, and privacy risks, leaving bystanders and first responders without intelligent support.
Target Users	Bystanders at disaster/accident scenes, first responders, emergency medical teams, and disaster relief coordinators.

Solution	PulseMesh provides fully on-device multimodal medical triage using camera (visual injury detection) and microphone (symptom understanding via voice). It delivers instant life-saving guidance with sub-second response times, peer-to-peer mesh emergency coordination, and zero-cloud privacy guarantees.
Tech Stack	Vision Model (injury detection), Offline Speech-to-Text, Distilled LLM (medical reasoning), Camera + Microphone input, Voice Guidance output, P2P Mesh networking, Encrypted Local Logs

6. Nyaya Mitra: Intelligence, Unchained

Team: The Alvengers | Leader: Shreyas Patankar

Problem / Idea	Access to justice in India is severely limited, especially for marginalized communities. The legal system is complex, and affordable legal guidance is scarce in rural and underserved areas.
Target Users	Common citizens in India seeking legal guidance, rural populations, individuals involved in legal disputes, and legal aid organizations.
Solution	Nyaya Mitra (“Friend of Justice”) is an AI-powered legal assistant that provides unchained, on-device legal intelligence. It helps users understand their rights, navigate legal procedures, and access relevant laws in their local language, all without internet.
Tech Stack	On-device LLM, multilingual NLP, local knowledge base of Indian legal codes, offline-first mobile architecture

7. NEURO-SURGE: The “Air-Gapped” Industrial Intelligence Layer

Team: Sovereign Silicon | Leader: Vedashree Nimje

Problem / Idea	Industrial environments (manufacturing, energy, defense) operate in air-gapped networks where cloud connectivity is either unavailable or prohibited for security reasons. These sectors lack intelligent AI assistance despite having massive operational complexity.
Target Users	Industrial operators, manufacturing engineers, energy sector technicians, defense personnel, and organizations operating in air-gapped or classified environments.
Solution	NEURO-SURGE provides an air-gapped AI intelligence layer that runs entirely on local infrastructure, delivering predictive maintenance, anomaly detection, and intelligent decision support without any cloud dependency.
Tech Stack	On-device/on-premise AI inference, air-gapped deployment, industrial IoT integration, edge computing, local model serving

8. OrbitMind

Team: ClauseZero | Leader: Raghav Madan

Problem / Idea	Users need intelligent AI assistance for knowledge work, note-taking, and brainstorming but face privacy concerns and latency issues when relying on cloud-based AI tools. Sensitive ideas and data should not leave the device.
Target Users	Knowledge workers, students, researchers, writers, and professionals who need AI-powered ideation and organization tools with complete privacy.
Solution	OrbitMind is an on-device AI-powered knowledge assistant that helps users organize thoughts, generate ideas, and manage knowledge entirely offline, ensuring complete privacy and instant responsiveness.
Tech Stack	On-device LLM, local knowledge graph, privacy-first architecture, offline-capable inference engine

9. AR Floor Plan Creator – Offline Spatial Intelligence

Team: ByteCrew | Leader: Abhinav Ohri

Problem / Idea	Creating accurate floor plans traditionally requires expensive equipment, professional expertise, or cloud-based tools. In construction sites and remote locations, internet access is often unreliable, making cloud-dependent tools useless.
Target Users	Architects, interior designers, real estate agents, construction workers, and homeowners needing quick spatial measurements and floor plan creation.
Solution	An AR-powered floor plan creator that uses on-device AI and smartphone sensors (camera, LiDAR, accelerometer) to generate accurate floor plans in real-time without any cloud dependency, providing offline spatial intelligence.
Tech Stack	AR/computer vision, on-device spatial AI, smartphone sensor fusion (camera, LiDAR), offline 3D modeling, local inference engine

10. SightLock

Team: The One | Leader: Sharani B

Problem / Idea	Traditional authentication methods (passwords, PINs) are vulnerable to theft and shoulder surfing. Biometric systems often rely on cloud processing, creating privacy risks and failing without internet connectivity.

Target Users	Privacy-conscious smartphone users, enterprise security teams, and individuals in environments where traditional authentication methods are insufficient.
Solution	SightLock provides an on-device, vision-based authentication and security system that uses local AI for facial recognition and gaze detection, ensuring secure access without transmitting any biometric data to the cloud.
Tech Stack	On-device computer vision, local face recognition models, gaze detection AI, privacy-preserving biometric processing

11. EdgeCare: A Fully Offline, Privacy-First Health Intelligence System Using On-Device AI

Team: LogicX | Leader: Atshayaa B

Problem / Idea	Healthcare access is limited in remote and rural areas where internet connectivity is poor or nonexistent. Patients' sensitive health data is at risk when processed through cloud-based AI services.
Target Users	Rural healthcare workers, patients in underserved areas, community health volunteers, and individuals seeking private health intelligence.
Solution	EdgeCare is a fully offline health intelligence system that runs AI models directly on-device to provide symptom assessment, health guidance, and medical knowledge access without cloud dependency, ensuring patient data privacy.
Tech Stack	On-device health AI models, local medical knowledge base, privacy-first architecture, offline inference engine, mobile-optimized deployment

12. EYE2ACTION: Multimodal Mobile Language Action Model

Team: Benne Dosa | Leader: ABHINAV RAJPUT

Problem / Idea	Existing AI assistants require cloud connectivity and are limited in their ability to understand visual context from the real world. Users need an AI that can see, understand, and act on visual inputs entirely on-device.
Target Users	Visually impaired individuals, field workers, maintenance technicians, and anyone needing AI-powered visual understanding and task guidance on mobile devices.
Solution	EYE2ACTION is a multimodal mobile AI model that combines vision and language understanding to convert visual inputs (camera feed) into actionable guidance entirely on-device, enabling see-and-act AI assistance without cloud dependency.

Tech Stack	On-device multimodal AI (vision + language), mobile-optimized inference, camera-based visual understanding, action generation pipeline

13. Vector File Manager

Team: techsharks | Leader: Kalyani Soni

Problem / Idea	Cloud-based AI file management compromises privacy by sending personal data to servers. Standard file search fails without exact filenames. Manual file sorting and categorization waste hours of user time.
Target Users	Field specialists needing offline access to technical documents, privacy-first parents managing sensitive medical files, and busy freelancers organizing client materials during commutes.
Solution	Vector is a next-generation “Sovereign File Governor” that uses on-device AI to turn smartphone storage from a passive filing cabinet into an active, thinking assistant. Features include AI-powered semantic search, automatic categorization, and intelligent garbage collection, all running locally.
Tech Stack	Triple Agent Architecture: 1) DeepSeek-R1-Distill-Qwen-1.5B (reasoning/logic, ~1.2GB RAM), 2) Llama 3.2 1B (summarization/text extraction, ~0.8GB RAM), 3) Nomic-Embed-Text-v1.5 (semantic search/embeddings, ~0.3GB RAM). Runanywhere SDKs for on-device deployment.

14. DiagnoShield – Diagnosis Without Borders

Team: Winning Edge | Leader: Chinmay Khare

Problem / Idea	Millions of people in remote and underserved regions lack access to timely medical diagnostics. Cloud-based diagnostic tools are useless in areas with poor or no connectivity, and sensitive medical data faces privacy risks.
Target Users	Healthcare workers in remote areas, rural patients, field medics, NGO health programs, and community health volunteers.
Solution	DiagnoShield brings medical diagnostic intelligence directly to the device, enabling on-device AI-powered symptom analysis, image-based diagnostics, and health assessments without any internet requirement, making diagnosis truly borderless.
Tech Stack	On-device diagnostic AI models, medical image analysis, local health knowledge base, offline-first mobile architecture

15. SentinelOS – The Offline AI Life Guardian

Team: QuadCoders | Leader: Govind Choudhari

Problem / Idea	In emergency and survival situations, people cannot rely on cloud-connected services. Current safety apps become useless when networks go down during the moments they are needed most.
Target Users	Solo travelers, hikers, outdoor enthusiasts, elderly individuals living alone, and anyone in emergency-prone environments.
Solution	SentinelOS is an offline AI life guardian system that monitors user safety, detects emergencies through on-device sensors and AI, and provides life-saving guidance and automated alerts entirely without cloud connectivity.
Tech Stack	On-device AI for emergency detection, sensor fusion (accelerometer, GPS, microphone), local alert system, offline safety protocols

16. SurvivalMind

Team: Redanians | Leader: Harshit Ashri

Problem / Idea	In remote, disconnected, or disaster-hit regions, cloud-based AI services become useless. Hikers, rescue workers, and rural health volunteers need intelligent tools for wound diagnosis, survival guidance, and hazard identification, but face unreliable connectivity, privacy risks, and critical latency.
Target Users	Hikers, rescue teams, rural health volunteers, wilderness explorers, and disaster response workers.
Solution	SurvivalMind transforms any modern smartphone into a standalone lifeline with four core modules: AI Wound Diagnosis (vision-based severity assessment), Local Survival Expert (LLM for first-aid/shelter/mental support), Flora & Hazard ID (offline computer vision for plant/hazard identification), and Offline Maps & POIs (vector-based resource locators).
Tech Stack	Quantized LLM (4-bit / QLoRA, LLaMA 3), Vision Models (8-bit MobileNet), Voice Input (Whisper Tiny int8), Zero Data Egress, offline-first architecture optimized for consumer hardware
